

In the claims:

Following is a complete set of claims as amended with this Response.

1. (Currently Amended) A method comprising:

receiving a version of a radio signal from a remote terminal at each of a plurality of antennas of a base station;

comparing characteristics of the received versions of the remote terminal signal received at the plurality of antennas;

using the comparison to determine whether reception at the remote terminal of radio signals transmitted from the base station to the remote terminal is likely to be improved by diversity transmission from the base station ;

selecting to use diversity transmission for radio signals transmitted from the base station to the user remote terminal if reception at the remote terminal is likely to be improved;

setting transmit weights for a first signal and at least one delayed diversity signal copy based on the determining so that the delayed diversity signal copy receives a weight of greater magnitude if the reception is likely to be improved and a weight of lesser magnitude if the reception is not likely to be improved; and

transmitting radio signals to the remote terminal based on the setting selection .

2. (Currently Amended) The method of claim 1, wherein comparing characteristics comprises determining a spatial signature of the received signal.

3. (Original) The method of claim 2, wherein comparing characteristics comprises determining relative phases and amplitudes of the received signal.

4. (Original) The method of claim 1, wherein determining comprises estimating an amount of scattering of the received signal.
5. (Original) The method of claim 1, wherein determining comprises estimating a level of multipath interference.
6. (Original) The method of claim 1, wherein transmitting comprises transmitting a radio signal from two different spaced apart antennas.
7. (Canceled)
8. (Original) The method of claim 1, wherein transmitting comprises transmitting a radio signal from the plurality of antennas with two different phase and amplitude signatures.
9. (Original) The method of claim 1, wherein transmitting comprises transmitting a radio signal from the plurality of antennas with two different sets of beam forming weights.
10. (Original) The method of claim 1 wherein transmitting comprises setting transmit weights for a first signal and at least one delayed diversity signal copy based on the determining so that the delayed diversity signal copy receives a weight of greater magnitude if the reception is likely to be improved and a weight of lesser magnitude if the reception is not likely to be improved.
11. (Original) The method of claim 10 wherein transmitting further comprises transmitting using a spatial signature for the first signal and the at least one delayed diversity signal copy.
12. (Currently Amended) A method comprising:
receiving a radio signal from a remote terminal at a base station;

measuring characteristics of the signal received from the remote terminal; ~~and~~
selecting an amount of beam forming and an amount of transmit diversity to be
applied to signals transmitted from the base station to the remote terminal using the
measured characteristics of the signal received from the remote terminal; and
applying weighting coefficients to a first transmitted signal and a delayed copy of
the first transmitted signal based on the selection, the amount of transmit diversity being
greater as the magnitude of the weights are made more equivalent.

13. (Original) The method of claim 12, wherein selecting comprises
estimating a spatial signature of the received signal by comparing relative phases and
amplitudes of the received signal as received at a plurality of antennas.

14. (Original) The method of claim 12, wherein selecting comprises
estimating an amount of scattering of the received signal.

15. (Original) The method of claim 12, wherein selecting comprises
determining a level of multipath interference.

16. (Original) The method of claim 12, wherein selecting comprises
measuring a signal quality of the received signal.

17. (Original) The method of claim 16 wherein selecting further comprises
measuring a signal quality of the received signal as received at a plurality of antennas and
comparing the measured signal qualities to each other.

18. (Original) The method of claim 12, wherein measuring further comprises
measuring the received signal amplitude at a plurality of antennas and wherein selecting
comprises comparing the measured amplitudes to each other.

19. (Canceled)

20. (Original) The method of claim 19 wherein the delayed copy is transmitted from an antenna spaced apart from the antenna that transmits the first transmitted signal.

21. (Original) The method of claim 19, wherein the delayed copy is delayed by at least the duration of one quarter of the reciprocal of the bandwidth of the modulated waveform of the radio signal.

22. (Original) The method of claim 12 wherein selecting comprises choosing one of either beam forming or transmit diversity to be applied to the transmitted signal.

23. (Currently Amended) A machine-readable medium having stored thereon data representing instructions which, when executed by a machine, cause the machine to perform operations comprising:

receiving a version of a radio signal from a remote terminal at each of a plurality of antennas of a base station;

comparing characteristics of the received versions of the remote terminal signal received at the plurality of antennas;

using the comparison to determine whether reception at the remote terminal of radio signals transmitted from the base station to the remote terminal is likely to be improved by diversity transmission from the base station ;

selecting to use diversity transmission for radio signals transmitted from the base station to the user remote terminal if reception at the remote terminal is likely to be improved;

applying weighting coefficients to a first transmitted signal and a delayed copy of the first transmitted signal, the amount of transmit diversity being greater as the magnitude of the weights are made more equivalent; and

transmitting radio signals to the remote terminal based on the selection .

24. (Original) The medium of claim 23, wherein the instructions for comparing characteristics comprise instructions which, when executed by the machine, cause the machine to perform further operations comprising determining relative phases and amplitudes of the received signal.

25. (Original) The medium of claim 23, wherein the instructions for transmitting comprise instructions which, when executed by the machine, cause the machine to perform further operations comprising transmitting a radio signal at two different times, the times being spaced by at least the duration of one quarter of the reciprocal of the bandwidth of the modulated waveform of the radio signal..

26. (Original) The medium of claim 23, wherein the instructions for transmitting comprise instructions which, when executed by the machine, cause the machine to perform further operations comprising transmitting a radio signal from the plurality of antennas with two different sets of beam forming weights.

27. (Currently Amended) A machine-readable medium having stored thereon data representing instructions which, when executed by a machine, cause the machine to perform operations comprising:

receiving a radio signal from a remote terminal at a base station;

measuring characteristics of the signal received from the remote terminal; ~~and~~

selecting an amount of beam forming and an amount of transmit diversity to be applied to signals transmitted from the base station to the remote terminal using the measured characteristics of the signal received from the remote terminal;

applying weighting coefficients to a first transmitted signal and a delayed copy of the first transmitted signal, the amount of transmit diversity being greater as the magnitude of the weights are made more equivalent.

28. (Original) The medium of claim 27, wherein the instructions for selecting comprise instructions which, when executed by the machine, cause the machine to perform further operations comprising estimating a spatial signature of the received signal by comparing relative phases and amplitudes of the received signal as received at a plurality of antennas.

29. (Canceled)

30. (Currently Amended) An apparatus comprising:

a plurality of antennas at a base station to each receive a version of a radio signal from a remote terminal; and

a processor

to compare characteristics of the received versions of the remote terminal signal as received at the plurality of antennas,

to determine, using the comparison, whether reception by the remote terminal of radio signals transmitted from the base station to the remote terminal is likely to be improved by diversity transmission , ~~and~~

to select diversity transmission for radio signals to be transmitted from the base station to the remote terminal if the reception is likely to be improved,

and to apply weighting coefficients to a first transmitted signal and a delayed copy of the first transmitted signal, the amount of transmit diversity being greater as the magnitude of the weights are made more equivalent.

31. (Original) The apparatus of claim 30, wherein comparing characteristics comprises determining a spatial signature of the received signal.

32. (Original) The apparatus of claim 30 further comprising two different spaced apart antennas from which to transmit radio signals with diversity.

33. (Original) The apparatus of claim 30 wherein the diversity transmission comprises a first signal and at least one delayed copy of the first signal.

34. (Currently Amended) An apparatus comprising:
a receive array at a base station to receive a radio signal from a remote terminal;
a processor at a base station to measure characteristics of the signal received from the remote terminal and to select one of either ~~an amount of~~ beam forming or ~~and an amount of~~ transmit diversity to be applied to signals transmitted from the base station to the remote terminal using the measured characteristics of the signal received from the remote terminal.

35. (Original) The apparatus of claim 34, wherein the processor selects an amount of transmit diversity by applying weighting coefficients to a first transmitted

signal and a delayed copy of the first transmitted signal, the amount of transmit diversity being greater as the magnitude of the weights are made more equivalent.

36. (Canceled)

37. (Original) The method of claim 1, wherein the received radio signal conforms to a standard for at least one of TDMA, GSM, DAMPS, CDMA, FDMA and TDD.

38. (Original) The method of claim 12, wherein the received radio signal conforms to a standard for at least one of TDMA, GSM, DAMPS, CDMA, FDMA and TDD.

39. (Original) The apparatus of claim 30, wherein the apparatus is comprised in at least one of a TDMA, a GSM, a DAMPS, a CDMA, a FDMA and a TDD radio communications system.

40. (Original) The apparatus of claim 34, wherein the apparatus is comprised in at least one of a TDMA, a GSM, a DAMPS, a CDMA, a FDMA and a TDD radio communications system.
